

Pay by Bank

A better way for UK and European merchants to get paid. Everything on one page: who the customer is, why they buy, and what the product does — and does not do.

Owner: Commercial · Confidential

THE CUSTOMER IN ONE LINE

A UK or EU/EEA **high-risk merchant** — primarily iGaming, casino or betting — with 100k+ transactions a month, where card friction, settlement delay, chargeback exposure or payment cost materially affects margin and operations.

THE BUYER

Payments Operations Lead

At high-risk merchants — iGaming, casino and betting first.

THE CYCLE

6-12 weeks · 3-6 months

SMB merchants move in weeks; enterprise in months.

WHERE IT RUNS

UK live · EU/EEA late Q2 2026

Mastercard Open Banking rails — 19 markets, 2,900+ banks.

Part 1 — The customer

Who it's for

The ideal Pay by Bank customer is a UK or European merchant or payment-driven platform where **incoming customer payments** directly affect margin, settlement speed, cash flow, customer experience, fraud exposure, reconciliation or daily operations.

Pay by Bank covers the **customer → merchant** direction only — checkout, deposits, top-ups, instant customer funding. If the customer mainly needs outgoing payments (player payouts, or refunds as a standalone flow), it is not an Aryze fit today.

This customer is not looking for another checkout option. They have a real payment problem that costs them money, time or customers.

Where it runs

- **Scope:** UK + EU/EEA merchants. Mastercard Open Banking rails cover 19 European markets and more than 2,900 banks.
- **Staged rollout:** UK is live via the Volt.io partnership. The EU/EEA rollout begins late Q2 2026, pending the Volt-extension contract. Until then, EU prospects are pipeline conversations — not commit-to-go-live timelines.
- **Bank depth varies by country** — confirmed per customer, never guessed.

Strongest verticals, in order

All within the high-risk frame:

1 iGaming, casinos, betting

The core segment and primary focus. High deposit frequency, high chargeback exposure, expensive card fees, and pressure from Visa VAMP (the 1.5% threshold from April 2026).

2 Trading platforms

Instant-funding flows, high average ticket, payment performance directly business-critical.

3 Other high-risk merchants

Categories where card rails are expensive, fragile or restricted, or where acquiring is hard to get.

4 Secondary (longer tail)

Wallets, remittance, e-commerce with high average ticket or poor card economics — only where the high-risk pain is clear.

Outside the ICP — separate market-entry cases. Nightlife and events (bars, clubs, festivals) share the same high-risk pain and were analysed as a new market in May-June 2026, with a board decision on a summer pilot in Denmark and the UK. The case is kept separate so it stays clear what is proven core and what is experiment: Nightlife — Pay by Bank.

The five pains we solve

1. **High payment costs** — card fees scale with the amount. Scheme fees have risen 75%+ since 2021 for large merchants.

- 2. Slow settlement** — money is not available in time to support cash flow, liquidity or operations.
- 3. Operational friction** — refunds, reporting, reconciliation and payment-status tracking create work for finance and ops.
- 4. Chargeback and dispute burden** — iGaming runs 2–4% chargeback rates against 0.5–1% in normal e-commerce. Cost per dispute: EUR 20–100, with a loaded cost around 2.5× the transaction value.
- 5. Lack of control** — insufficient visibility across the payment flow from initiation to settlement.

What the customer wants

"Get paid faster, with less friction and more control."

This customer does not want a future-of-money story. They want a better payment operating model: lower cost, faster settlement, less dispute burden, cleaner reconciliation, and better control over incoming funds.

Fit & walk-away signals

Strong-fit signals — the more that are present, the better the fit:

Payment performance discussed at leadership level

Card fees visible in the payment P&L

Chargebacks, fraud or disputes operationally relevant

Settlement speed has real cash-flow impact

There is an internal payment owner

Payment operations already painful or strategically important

Actively looking for alternatives to card rails

Deposits, top-ups or customer-funding flows commercially important

Technical capacity to integrate a new rail

Walk-away signals — when these are true, it is not a fit:

Operates outside the UK + EU/EEA

Payment volume low or low-priority

Card costs not a meaningful issue

Settlement speed does not matter to them

They just want "more payment methods"

No internal payment owner

Cannot support an integration

No clear pain around cost, settlement, reconciliation, chargebacks or control

Primary need is outgoing payments (payouts, withdrawals, standalone refunds) — we cover the incoming direction only. If the use case can be split, we take the deposit side now and flag payouts as open.

Wants AIS features (account aggregation, balance checks, account data) — we are PIS-only, no AIS at all

Wants standalone recurring payments — only possible via Mastercard Payment Services DK/NO until PSD3 (estimated 2027-28)

WHY THE HIGH-RISK FRAME MATTERS — CHARGEBACK RATE

iGaming runs far higher chargeback rates than standard e-commerce. A2A is irrevocable and SCA-approved in the customer's bank — there is no scheme dispute path, so chargebacks fall to near zero. Bars scaled to a 5% axis.

Best-fit company profile

- Operates in the UK or EU/EEA
- Significant incoming payment volume — sweet spot 100k+ transactions a month, average ticket EUR 35+
- Depends heavily on digital payments
- Feels cost, friction, delay or operational problems in card-based flows
- Payment performance sits on the leadership agenda, not in the back office
- Has a clear internal owner (payments, finance, product, risk or operations)
- Has the technical capacity to integrate a new payment rail

Buying triggers

A prospect becomes a strong fit when at least one of these is active:

- Card costs are too high and eat margin
- Settlement is too slow for cash flow
- Chargebacks and disputes create financial and operational burden
- Refund handling is painful
- Reconciliation creates too much manual work
- Payment status visibility is weak
- The current payment flow is too indirect to control
- The business needs instant or near-instant customer funding (deposits, top-ups)
- Card flows fit the customer journey poorly
- **Payment performance has been discussed at leadership level** — the strongest signal of all

Who buys, in order

ROLE	ANGLE
Payments Operations Lead (primary)	Responsible for payment performance and exception handling. Sell on operations, integration and control.
Head of Payments / Director of Payments	Strategic buyer of the payment stack. Pitch rails, coverage, partnership.
CFO / Finance Director	Co-buyer on ROI. Pitch cost savings in numbers, predictability, EBITDA impact.
COO / Payment Operations Director	Cares about chargeback burden and operational friction.

The buying committee often also includes the Head of Fraud or Risk, the CTO or engineering lead, and the finance-systems owner, though they are rarely the first point of contact. Each role weighs the decision differently: a Payments Operations Lead on operations and integration, a CFO on numbers and ROI — so the conversation shifts with the person in the room.

Qualification questions for the first call

1. How many transactions a month today? Average ticket?

2. What total card fee % do you pay (acquiring + scheme + interchange)? How much has it risen since 2021?
3. Where is your chargeback rate today? Do you feel pressure from the VAMP 1.5% threshold from April 2026?
4. Which markets are critical — UK only, or specific EU countries?
5. Which PSP / payment stack do you run today? Do you already have an open-banking provider (Trustly, TrueLayer, Volt, Token, Banked)?
6. What ranks highest among your pains: cost, chargebacks, conversion, settlement speed, or operations/reconciliation?
7. Who joins the decision — Payments, Finance, Risk, Tech, Compliance?
8. Do you have the engineering capacity and timeline to integrate a new rail?

Volume, card cost and the current payment stack — questions one, two and five — most shape whether there is a concrete proposal to make.

How we position it

"A direct UK/EU account-to-account payment rail that helps merchants get paid faster, with lower friction and stronger operational control than card-based flows."

The positioning stays close to payment performance rather than an abstract innovation story — this customer needs a better way to get paid, not a new financial paradigm.

Market context — June 2026

- **Visa VAMP drops to 1.5% in April 2026** (acquirers held at 0.5–0.7%). Real pressure on iGaming chargeback rates that typically run 2–4%.
- **Scheme fees up 75%+ since 2021** for large merchants — margin pressure on card-based flows.
- **UK A2A pricing benchmark:** down to GBP 0.50 fixed per transaction against roughly 4% average on cards.
- **A2A is only about 5% of UK e-commerce** — an early market with room for early movers.
- **The Open Banking PISP licence framework is mature;** Mastercard runs AISP + PISP across Europe and the UK with 99.99%+ uptime.

The competitive field

We do not sell into an empty market, and our positioning acknowledges it.

COMPETITOR	POSITION
Trustly	Dominant in Europe: 6,300+ banks, 29 countries. Strong in the Nordics, growing in the UK. Pay-N-Play casino flow is their signature product.
TrueLayer	Strong in the UK. bet365 went live on TrueLayer Pay by Bank in the UK and Germany in 2026 — a key market reference.
Volt	European, growing, mid-tier.
Token.io	A2A infrastructure, developer-focused.
Banked	UK-focused, smaller.
GoCardless Instant Bank Pay	Direct-debit heritage, growing A2A offer.

Aryze's positioning acknowledges these competitors rather than claiming blanket superiority. The room to win is the specific job a customer has that is not solved today — the Mastercard rail approach, coverage in specific markets, pricing structure, theming, or integration time — and what Aryze can actually deliver, rather than matching a competitor feature for feature.

Part 2 — The value proposition

The customer's jobs

FUNCTIONAL

Receive incoming payments reliably and fast; keep payment cost predictable and under control; reduce dispute and chargeback burden; reconcile incoming funds cleanly; stay compliant with scheme and regulatory demands (PSD2, VAMP, KYC/AML); run working deposit, top-up and customer-funding flows.

PROFESSIONAL

Report payment performance to leadership and the board; stand behind the payment stack in front of risk, finance and engineering; negotiate better terms with acquirers and schemes.

EMOTIONAL

Feel in control of where the money sits and when; trust that the rails will not suddenly fail (acquirer pull, scheme pressure); run a payment setup that costs no more than it should.

From pain to relief

Cost — card fees scale with the amount; scheme fees up 75%+ since 2021; loaded cost per dispute around 2.5× the transaction value.

Fixed fee per transaction — cost no longer scales with the amount. A2A bypasses scheme-fee increases. The payment line becomes predictable to budget.

Operational — chargebacks and disputes eat finance and risk time; refund handling manual; reconciliation creates monthly work; status hard to see end to end.

Near-zero chargebacks — A2A is irrevocable and SCA-approved → less dispute burden. Direct bank-to-bank moves visibility close to real time. Cleaner reconciliation through direct payment data.

Risk — Visa VAMP threshold drops to 1.5% in April 2026; existing chargeback rates threaten scheme relationships; acquirers can pull card service in regulated categories.

Room under the threshold — a lower chargeback rate creates headroom under Visa VAMP. Less dependence on a single acquirer.

Conversion — card details at checkout create friction; 3DS pop-ups drop conversion; card declines hit legitimate customers.

No card friction — no card details, no 3DS pop-up — SCA happens directly in the customer's bank. RememberMe makes repeat payments faster.

The pains

TYPE	PAIN
Cost	Card fees scale with the amount — margin squeezed at high average tickets. Scheme fees up 75%+ since 2021. Loaded cost per dispute around 2.5× the transaction value in high-risk sectors.
Operational	Chargebacks and disputes eat finance and risk time (iGaming: 2–4% chargeback rates against 0.5–1% in normal e-commerce). Refund handling is manual and fragmented. Reconciliation creates monthly work. Payment status is hard to see end to end.
Risk	The Visa VAMP threshold drops to 1.5% in April 2026 — existing chargeback rates threaten scheme relationships. Acquirers can pull card service in regulated categories. Fraud and dispute exposure.
Conversion	Card details at checkout create friction. 3DS pop-ups drop conversion. Card declines hit legitimate customers.

The gains

LEVEL	GAIN
Required	Predictable, controlled payment cost. Settlement fast enough for cash flow. Falling chargeback exposure. Visibility on every payment from initiation to settlement.
Expected	Integration without a checkout rebuild. Theming and branding control on the payment screen. Stable coverage in their operating markets.
Desired	Recurring and refund flows on the same rail. Account-level data for verification and insights. 24/7 support and SLAs that match operations.
Unexpected	Higher conversion where A2A beats cards on speed. Lower fraud-team burden. Negotiating power with the acquirer once A2A is a real option.

What we deliver

- **The Pay by Bank A2A rail** — on Mastercard Open Banking infrastructure: 19 European markets, 2,900+ banks. Customer → merchant only (checkout, deposits, top-ups, customer funding).
- **Fixed fee per transaction** — not a percentage of the amount.
- **RememberMe** — a token valid for 15 months. Repeat depositors approve in roughly half the clicks of a first deposit (about 50% faster repeat flow). A direct conversion gain on repeat deposits.
- **Theming and custom branding** at checkout — logo, colours, font — so the merchant's brand carries through.
- **KYB + integration + go-live package** — we map the customer's flow, run the integration and support go-live.
- **The PISP frame** via Mastercard's licence — we operate on the partner's licence in the UK and EU under Open Banking / PSD2.
- **Sandbox and savings calculator** for evaluation and a first estimate on the customer's own numbers.
- **99.99%+ uptime** on the Mastercard Open Banking platform — geo-redundancy, automatic failover, 24/7 support.

How that creates the gains

- **Predictable cost structure** — finance gets budget control.
- **Better payment economics** for high-volume merchants.

- **Mastercard-rail credibility** — not a startup experiment.
 - **Theming depth** — the merchant keeps brand consistency.
 - **Sandbox + savings calculator** — we show numbers on the customer's own data before they commit.
 - **The PISP frame and UK partner licence** — the compliance story is ready.
-

Part 3 — The product

Overview

Pay by Bank lets a business **receive incoming customer payments** through Open Banking payment flows on Mastercard's rails instead of traditional card rails. The customer approves the payment directly in their own bank (strong customer authentication), and the money moves bank to bank — not through a card scheme.

Flow direction — important: Pay by Bank covers **customer → merchant** only: checkout, deposits, top-ups, instant customer funding. The opposite direction (payouts, withdrawals, standalone refunds) is not productised at Aryze.

For the merchant the value is not another checkout option. The value is a cleaner, faster, more controllable payment flow.

What's in the box

In the box — confirmed

- ✓ **A2A payments on Mastercard rails** — customer → merchant: checkout, deposits, top-ups. The customer approves directly in their bank.
- ✓ **Fixed fee per transaction** — our main argument against cards: the same price regardless of amount.
- ✓ **Near-zero chargebacks** — A2A is irrevocable and SCA-approved in the customer's bank. No scheme dispute path.
- ✓ **RememberMe** — a token valid for 15 months. Repeat depositors approve in roughly half the clicks of a first deposit — a direct conversion gain on repeat flows.
- ✓ **Theming / custom branding** — logo, colours and font at checkout, so the merchant's brand carries through.
- ✓ **Structured onboarding** — map the flow → KYB → integration & test → go live, with callbacks, reporting and transaction monitoring built in.
- ✓ **Platform reliability** — 99.99%+ uptime on the Mastercard Open Banking platform: geo-redundancy, automatic failover, 24/7 support.

Deliberately not in the box

- **AIS features** — account owner verification, balance checks, account aggregation, spending insights, KYC via open banking, combined AIS+PIS flows.
- **Payouts (merchant → customer)** — withdrawals and standalone refunds are not live at Aryze. If a customer asks: we cover the incoming direction today; outgoing is on the roadmap.
- **Standalone recurring** — not possible under PSD2; only via Mastercard Payment Services DK/NO. Standalone expected with PSD3 (estimated 2027–28).
- **Refunds** — always check with product before promising refund flows.

Aryze operates **PIS only**, on the **customer → merchant** direction. The items on the right exist on Mastercard's platform or on a roadmap, but are not productised at Aryze.

Where a customer references a Mastercard feature that Aryze has not productised, it is named as open rather than implied as available.

How it is sold

A commercial, merchant-focused motion: direct merchant conversations, warm introductions, payment-focused partnerships, the website and savings calculator, LinkedIn, targeted outreach, and product demos with sandbox access. The buying group typically spans finance (cost and cash flow), payments and product (the payment journey), risk and fraud (disputes and chargebacks), operations (reconciliation and reporting) and engineering (the integration). The primary buyer is the **Payments Operations Lead**; secondary buyers are the Head of Payments, CFO and COO. The product is sold on payment performance — not technical novelty.

Pricing

Fixed fee per transaction — the opposite of card rails, which scale with the amount. The concrete price depends on volume, markets and scope. The savings calculator produces an estimate on a customer's own numbers, set against their current setup.
